JOHN J. MARINO
COMMISSIONER

(617) 727-3218

Dear Reader:

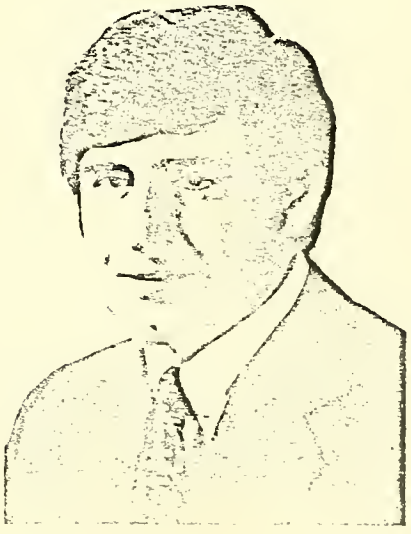
I am pleased to present this report on the travel industry in Massachusetts, undertaken during 1976 by the University of Massachusetts' Departments of Hotel, Restaurant and Travel and Economics.

This report represents the Third Annual Edition describing Massachusetts travelers' economic impact, vacation trips, travel habits and characteristics during the 1976-1977 year.

I urge other government agencies, industry and labor organizations, and private sector individuals who are concerned with the growth and proper planning of the travel industry to utilize this report.

Sincerely,

John J. Marino



Acknowledgments

The Massachusetts Department of Commerce and Development, the sponsor of this Report, has been most helpful in its support of the study. We are grateful to the three officials there who have been supportive of the project: John J. Marino, Commissioner; Ernest M. Lucci, Deputy Commissioner; and Francis J. Shaw, Director of the Bureau of Vacations and Travel. Without their assistance we would have been unable to proceed; without their encouragement, we would not have wanted to proceed.

Two other departments of the Massachusetts state government have been extraordinarily helpful in providing us with data from their files on a regular basis. Any careful reader of this Report will realize that the figures and analyses herein literally could not have been created without the information supplied. We owe a great debt to each department. The Department of Corporations and Taxation has supplied us with detailed information from the rooms tax and meals tax; these figures are a crucial underpinning of the entire study. Owen L. Clarke, Commissioner, generously arranged for us to have access to the data. Phyllis O'Halloran, Chief of Data Services, obligingly provided the information through her division. Lawrence McCabe, Chief of Programming, has been extremely helpful--and prompt--in complying with our requests for large volumes of information.

The Department of Employment Security has supplied, on a regular basis, very large amounts of data on employment and

wages in various industries. Robert D. Crosier, Commissioner, arranged for this through his good offices. Robert Ganong, Chief Supervisor, Occupation-Industry Research Department has complied with the task of providing us with the relevant computer tapes every three months, and has answered many questions concerning the interpretation of data.

John T. Driscoll, Chairman, and Harold Finn, Superintendent of Tolls, Massachusetts Turnpike Authority, have kindly provided crucial assistance in obtaining permission for us to conduct interviews at toll booths along the Turnpike. We could not have completed the study without their cooperation.

The owners and managers of a great many hotels, motels and campgrounds have provided us with confidential information essential to this study. Their cooperation has been invaluable. We cannot mention them by name for the list is a long one and, more importantly, our pledge of confidentiality would be violated by doing so.

Officials at Logan Airport--in particular Ronald Brinn and Marcia Duffy--were helpful in obtaining permission for us to conduct interviews there, and in providing information. The U.S. Immigration and Naturalization Service at Logan Airport (Thomas Prokoprowicz, Chief) kindly granted permission for interviews to be conducted in the areas under its control.

Statistical coverage of travel and tourism is still at an early stage of development, we think. There are encouraging signs that efforts are being made in other states as well as Massachusetts to improve the situation. On a national scale,

the efforts of the U.S. Travel Data Center are becoming well known among people interested in the area. These efforts all aid each other, as practitioners can learn from each others' successes and failures as well as their own. We happily acknowledge, therefore, our intellectual debt to the other active workers in this field.

A number of people on our staff contributed to the study in various ways. Donald J. Barnett, Jr. and Walter Baron both wrote computer programs--of which there are many--necessary for the study. Barnett, in particular, deserves special mention; the procedures he developed for handling the input-output table used are indeed masterpieces of the programmer's art.

We have been fortunate in having the services, at various times, of Jacqueline Cox, Cecile Daniel, Fred Moseley, Linda Powers, and Jill Ryder. They have served well as research assistants and as interviewers.

Eva Webber again did a superb and fast job of translating a barely legible manuscript into neatly typed text.

Highlights of the Report

1. Technical changes and improvements have been made in our procedures for analyzing data of 1976. These changes have led to minor revisions of the 1975 figures as well. Data are presented for both years on both a calendar year (January to December) and a newly-introduced "travel year" (November to October) basis.

2. The total number of visitor days in Massachusetts increased from 41.8 million in calendar year 1975 to 43.2 million in calendar year 1976--an increase of 2.4 percent. The largest increases were in Suffolk County (39 percent) and Worcester County (33 percent). Some counties--notably Barnstable and Dukes--showed substantial declines.

3. Total expenditures of travelers in Massachusetts rose from $988 million in calendar year 1975 to $1,132 million ($1.13 billion) in calendar year 1976. Some of this rise represents inflation, some a rise in the number of visitor days.

4. Employment due directly to travelers' expenditures--employment of people directly involved in providing services to travelers--reached 46.6 thousand full-time equivalent jobs in 1975, and 51.8 thousand in 1976.

These amounted to 2.5 and 2.8 percent of the total non-governmental payroll in the two years.

5. Payrolls due directly to travelers' expenditures amounted to $204.5 million and $241.4 million, in 1975 and 1976, respectively. This amounted to 1.2 percent of total payrolls in 1975, and 1.3 percent in 1976.

6. Average annual wages paid in the travel service industries was $4392 in 1975, and $4664 in 1976. As pointed out in the Report for 1975, these figures do not include tips, meals, uniform allowances, or rooms; nor do they include income of independent businesspeople. The average incomes received by workers in the travel service industry are therefore higher than this.

7. State tax receipts collected directly from travelers in 1976 was $57.7 million, or about 5.1 percent of all expenditures. These taxes represent collections of room occupancy tax, meals tax, sales tax, liquor excise tax and gasoline tax, paid on services and commodities bought by travelers.

8. In 1975, some $834 million of income of Massachusetts residents and $1,691 million ($1.69 billion) of sales by Massachusetts residents was directly or indirectly attributable to travelers' expenditures. The correspond-

ing figures for 1976 were $965 million and $1,945 million ($1.94 billion).

9. Total employment (including self-employment) attributable to travelers' expenditures directly or indirectly was 87.2 thousand in 1975, and 100.9 thousand in 1976.

10. Total state tax receipts attributable, directly or indirectly, to travelers' expenditures in 1976 reached $123.2 million. Of these, about $57.7 million were collected from the travelers directly; the remainder is attributable to the results of the economic stimulus provided to the Massachusetts economy by travelers' expenditures.

11. A comparison of the total (direct and indirect) impact on the Massachusetts economy of $1 worth of sales to typical travelers and of the export (to other states) of three manufacturing industries showed the following:

Table IV-A

Multipliers (Impact per Dollar of Export Sales) of Four Selected Industries--1976

	Travel Service	Shoes	Electrical Computing Equipment	Electrical Measuring Instruments
Sales	1.718	2.091	1.622	1.728
Income	.852	.892	.700	.828
Employment (per $1000)	.089	.093	.056	.069
State Tax Receipts	.109	.057	.050	.053

Notes: 1. Export sales means sales to persons or firms not resident in Massachusetts.
2. Employment multipliers are given in number of jobs (full time equivalent) per $1000 of sales; others are in dollars per dollar of sales.

State tax receipts per dollar of sales in the travel service industries are roughly double that of other industries.

12. A large body of tables is grouped together at the back of the book. Tables 1 to 8, and 16 to 27 give statewide information; Tables 9 to 15 have information on individual counties, as well as the state totals. Tables 28 to 167 are fourteen groups of ten tables each, giving data on individual counties. Tables for each county are grouped together in alphabetical order.

Chapter I

Introduction

This report presents information on travel and tourism in Massachusetts during 1976. Comparable data for 1975, previously reported, are given also. The information given covers the following:

I. Travel to Massachusetts, 1976

Visitor days by county, classified by purpose of trip and by kind of lodging used

II. Expenditures of Travelers to Massachusetts, 1976

Expenditures per visitor day, and in total, by county, classified by purpose of trip and by kind of lodging used

III. Economic Impact of Travel and Tourism on Massachusetts, 1976

Employment and income in the travel service industries due directly to travelers' expenditures, by county

Employment, income, state tax receipts, local government tax receipts and total sales attributable as direct, indirect and induced effects of travelers' expenditures.

For 1976, we have made several technical improvements. Two of these are of sufficient import and interest to mention here, even though only one is clearly visible in the results.

First, we introduce the "travel year," with divisions ("seasons") tailored to the actual pattern of travel to Massachusetts. Second, we have redefined the boundaries of the "travel areas" within the state; these are the groups of counties which are treated jointly in some intermediate steps in the calculations, so that data for several counties can be pooled.

The Travel Year

Francis Shaw, Director of the Bureau of Vacation and Travel, Department of Commerce and Development and Michael Frucci, Executive Secretary of the Chamber of Commerce, Cape Cod, have commented to us that the conventional breakdown of the calendar year into four equal quarters, beginning in January, does not fit the travel service industry very well. They suggested that some other basis--to be called a "travel year" --might be more fruitful for analysis

Building on that suggestion, we investigated a variety of alternative definitions of "seasons"--i.e., of groups of months. We wanted to have "seasons" in which the amounts of business done by the travel service industry during each month in the season were about the same. As it happens, there are no patterns of seasonality which are uniform throughout the Commonwealth. Barnstable, Dukes and Nantucket have much higher peaks in July and August than do other counties--and fall off much faster in other months than the rest of the state. Some counties reach their peak not in July and August, but in September and October. Some do well in May and June; others do not. Yet it is highly desirable to have a single set of seasons for

all counties. After investigation of various alternatives, we concluded that the best division was one which used the following scheme:

Travel Season I (Low Season)--November through April

Travel Season II (Late Spring)--May, June

Travel Season III (High Summer)--July, August

Travel Season IV (Early Fall)--September, October

Such a calendar has the drawback of putting six months in a single season; yet those six months tend to be remarkably alike for the travel service industry. Similarly, each of the months in the remaining three "seasons" are rather similar to each other--and unlike months in adjacent "seasons."

The advantages of this travel year calendar are considerable. It corresponds more closely than the old one to the actual ebb and flow of activity in travel service over a typical year; as such, it will present a truer picture of patterns in the industry.

The mathematical analysis which justifies the use of the new travel year is contained in Appendix A.

The Travel Areas

We have grouped the state into six areas, rather than four as we had done previously. Our aim was to choose groupings which provided the greatest amount of homogeneity within areas, and gave the greatest amount of difference among areas. Our primary criterion was the seasonal fluctuations in commercial lodgings sales, and that of geographic contiguity. In all,

some twenty-four combinations were investigated. The one chosen is given below, along with the old system.

Old Areas (4)	New Areas (6)
Western (Berkshire, Franklin, Hampshire, Hampden, Worcester)	Berkshire (Berkshire)
Eastern (Essex, Middlesex, Norfolk, Bristol)	Pioneer Valley (Franklin, Hampshire, Hampden)
Suffolk (Suffolk)	Mid/South (Worcester, Bristol Plymouth)
Cape Cod (Barnstable, Dukes, Nantucket, Plymouth)	North/East (Essex, Middlesex, Norfolk)
	Suffolk (Suffolk)
	Cape/Isles (Barnstable, Dukes, Nantucket)

Because of the change in areas and because of other changes in our procedures (most notably an improved estimate of persons per occupied room in commercial lodgings), the previously published figures for 1975 have been revised somewhat. The effect of these revisions is small for the state as a whole, but substantial for a few individual counties and seasons. In this Report, we present revised figures for all of the 1975 data, as well as 1976 data. These new tables are all calculated on the same basis, and hence are comparable.

For the Future

The Massachusetts travel and tourism study is an on-going project. The measurement of travel in Massachusetts and its economic impact is a continuing process which will generate periodic reports. The first regular such report was the one issued in 1976 containing data for 1975. (That report was actually the second report of the research team. The first report was a discussion of methods and procedures, and a set of illustrative calculations.) The procedures used were designed (invented is perhaps a more appropriate verb) for this study. The process has been one of learning by doing. (In the absence of a well-developed set of methods in this field, learning by reading cannot be a sufficient basis. Technical improvements are being made in the procedures during every year; these changes improve the reliability of the figures presented. On occasion, we may revise earlier data in the light of improved methods (as, indeed, we have done this year). Such revision (analogous to that done by the federal statistical agencies) is not likely to make drastic changes in any figures.

In the 1975 Report, a series of technical appendices described the procedures used to produce the figures presented. It seems unnecessary to repeat these pages each year. Instead, we plan to publish a Manual which will be revised at intervals, giving in detail the sources, methods and procedures utilized in the production of data. Those interested only in results will have no need to read the Manual, which will be rather more technical in nature than the periodic Reports. Unlike the Reports, which will continue to be published regularly, the Manual

will be revised only when major changes in technique are initiated.

In addition to the Reports and the Manual, we plan to issue occasional Special Reports. One such Special Report is currently in active preparation; this will be a compilation, by town and by county, of the assessed valuation and real estate tax payments of all hotels and motels in the Commonwealth. Such information will give for the first time a picture of the value of real estate in the lodging industry, and will set out the contribution to local governments of these establishments.

Another Special Report planned for the near future is a thorough revision of the Hotel/Motel Inventory, first compiled in 1974. Periodic corrections have indicated that the turnover of establishments in the hotel/motel field has been high in the meantime. A number of new establishments have opened, many others have closed or changed names, and still others have converted some or all of their rooms to non-transient use. It is time to begin an entirely new inventory data collection process; we intend to do so during the coming year--as well as to institute a better procedure for updating.

Yet another Special Report envisaged is a Fact Book, a compilation of data on the economy of Massachusetts, with special reference to the travel service industry. This compilation will be made up mostly of information available publically, along with annotated data from the Reports. It will include information not always easily accessible to those without access to the resources of a large library--and of a skilled librarian. Such a Fact Book should prove useful to users of these Reports.

We are working also on two possible additions to the regular reporting series. First, we hope to be able to add reasonably reliable data on the number of visitors and the average length of stay, by county. Second, we have hopes of being able to give preliminary figures (subject to later revision)for numbers of visitor days, expenditures of travelers, and related information, at each of several dates during the year. It may be possible, for example, to report figures quarterly with perhaps a three to four month time lag, rather than the present six to twelve month lag. The feasibility of such a system is currently under study.

Chapter II

Visitors to Massachusetts

Total visitor days to Massachusetts in the 1976 calendar year were about 42.8 million, or about 43.2 million on a travel year basis. This represents an increase of some one million visitors over the figures for calendar 1975 of 41.8 million (as recalculated on the six-area basis). For the state as a whole. then, the volume of visitor days increased. Yet the experience of some individual counties was very different. Two counties--Suffolk and Worcester--experienced rises of more than 30 percent for the year as a whole--and more than 40 percent in the summer. Three more--Berkshire, Hampshire and Middlesex--experienced a rise of 10 percent or more. On the other hand, Barnstable County suffered a 20 percent decline in visitor days for the year as a whole--including a drop of more than 40 percent in the fall; and visitor days in Dukes County fell by 10 percent for the year.

Tables 1 through 4, grouped together in the back of this report, give the estimates of visitor days for each of the fourteen counties and the state as a whole. There are four sets of tables, one each for calendar year 1975, calendar year 1976, travel year 1975, and travel year 1976. These are presented in groups of tables for each county, so that all information for an individual county is together.

The tables for the 1975 calendar year cover the same

period as the corresponding tables in the Report for 1975. The figures given here were computed on the six-area basis, using revised techniques which yielded (we think) better estimates. The totals for the state have been revised downward slightly (by about 1.5 percent); percentage changes in estimates for individual counties and seasons are sometimes higher, and in both directions. These 1975 figures are fully comparable to the 1976 figures.

The 1976 travel year extends from November 1975 through October 1976; similarly, the 1975 travel year extends from November 1974 through October 1975. Our data begins with January 1975, and cannot be extended prior to that date. Consequently, the 1976 travel year is the first that we can provide. In order to faciliate its use, we have provided an approximation to the 1975 travel year obtained by substituting the data for November and December of 1975 for the missing ones of 1974. The result is that the 1975 travel year represents simply a rearrangement of the months of the 1975 calendar year, not the true travel year. Further, the 1975 and 1976 travel years, as recorded here, have two months (November and December of 1975) in common. The data should be interpreted with this in mind.

The estimates of total visitor days are computed by the procedure which can be summarized by a two-step process. First, for each county the number of visitor days in commercial lodgings is estimated, using a combination of data on the rooms tax imposed by the Commonwealth, and information from our sample of reporting hotels and motels. Second, the individual cells

of each table are estimated, using this figure (which is itself an element of each table) as a basis; the process involves multiplying the basic figure by expansion factors appropriate to each cell. These expansion factors are ratios derived from our questionnaire sample; they are, consequently, subject to sampling error--as are the results from any sample. We took a rather large sample in 1975, a somewhat smaller one in 1976. Statistical analysis showed no reason to believe that the true underlying ratios differed in the two years. There is no evidence that the proportion of visitors arriving for various purposes of visit, or using various types of accommodations, differed between the two years. If those proportions did not differ, then the ratios in question did not. Because of this, we thought it best to base the estimates on the same set of ratios for 1975 and for 1976; this way, sampling error in the estimation of the ratios will not be confused with true changes between 1975 and 1976.

The first step in the process of estimation creates a set of tables which are of considerable interest in their own right. These show the total sales, price per occupied room, number of occupied rooms, and person nights (person nights is another name for visitor days) in commercial lodging--by county and by month. These figures, being monthly, show in dramatic fashion the seasonal patterns in each county. For the most part, all the entries in these tables build up to a peak in the same months--not only total sales (in dollars) of rooms, but also the price per room, and the number of persons per

room. As a consequence, the number of occupied rooms, and the person nights in commercial lodging, varies somewhat less than sales. In Barnstable County, for example, sales in July were 12.1 times as great as in the previous January; but the number of occupied rooms was 6.9 times as great and the number of visitor days 7.6 times as great. (Prices are higher in July than in January; and the number of persons per room is higher also.) Still, no matter how one measures it, however, it is clear that seasonal fluctuations in Barnstable County are enormous!

Two sets of such tables, one for 1975, one for 1976, are presented in the county data section.

During 1976, we began conducting very short interviews with people to whom questionnaires were given. This allowed us to compare the responses given to the interviewer with the written responses made on the questionnaire. The interview was confined to a few simple questions: purpose of visit, type of lodging to be used, destination in Massachusetts, length of stay planned. Analysis of the results showed a good deal of consistency between answers given on the questionnaire sent in later, either after three days or after the visit was over. Most importantly, we did not find evidence of systematic changing of answers. There was a fair amount of apparently random changes. Some of these are easily attributable to change of plans, involving type of lodging and number of days--even destination, in some cases. These can be only predictions at the time of the interview, for actual decisions to be made later

in many cases. There was a large amount of switching among purposes of visit--a matter which we would not expect to be changing during the course of the trip. Some 20 percent of the responses were different--a large proportion. Most of these were switches from business to personal business and vice versa; from business to conventions; from visiting friends and relatives to recreation and vice versa; and from visiting friends and relatives to personal business and vice versa. There were, in fact, representatives of almost all possible pairs. That suggests that people do not think of their trip in terms of the sharply defined categories that we use for statistical purposes, but rather view their purposes as overlapping our categories. Logically, there is not a clear distinction between recreation and visiting friends and relatives; nor is there any reason why one trip cannot be for both objectives. Similar conclusions apply to most other pairs. Human behavior is too complex to be compressed into five pigeon holes!

It follows that the breakdown of visits by purpose of visit should be looked at as indications of general tendency only. Any one trip or any one day may cut across all five categories. We can (and do) neatly and correctly categorize people by type of accommodations used (a person either sleeps in a hotel/motel on a particular night, or he does not); no such claim can be made for the purpose of visit breakdown.

Still, the difficulties should not be overstated. We do find that the proportions of visitors who give their purpose as recreation are substantially larger in the summer than in

the winter; and are larger in Barnstable, Dukes and Nantucket Counties than elsewhere. This accords well with our intuition, and suggests that there is some validity in the "purpose of visit" categories.

$220 for every resident of Massachusetts; that is, the spending of travelers in Massachusetts has the same effect on the Massachusetts economy as if every man, woman and child in Massachusetts had spent an extra $220.

Of course, expenditures in individual counties vary enormously. This is partly due to the fact that some counties are much larger than others, and partly because some counties are much more popular as traveler destination than others. One way to remove the effect of differences in the size of counties is to express the expenditures in each county as a ratio to the population of that county. This is done in Table III-A and Table III-B.

The results are striking. Three counties--Barnstable, Dukes and Nantucket--stand out as being far higher than anywhere else in the state on this score. Such a conclusion is hardly surprising; yet the results dramatically underscore the great dependence of the economies of these counties on travelers.

Table III-A

Travelers' Expenditures Per County Resident, 1975

County	Travelers' Expenditures (000)	Population State Census 1975	Travelers' Expenditures Per County Resident
Barnstable	312186	126481	2468
Berkshire	16712	148069	112
Bristol	78942	461852	170

Chapter IV

Economic Impact of Travelers' Expenditures

Expenditures of travelers are sales of travel service industry firms to travelers. How do these sales affect the economy of Massachusetts? Consider the question of how the export of shoes affects the economy of Massachusetts; the principles are the same, the facts a bit easier to see.

When shoes are exported, obviously the shoe firm makes sales--some $307 million in 1975. Of this $307 million in sales, about 35 percent, or $107 million, goes to payrolls in the shoe industry--i.e., to pay workers in the shoe factories and offices. The $107 million is called the direct wages. Of the remainder, the composition is less certain. Some proportion goes to buy materials and services from other firms: leather, shoelaces, grommets, thread, power, and many other things. By one estimate, this accounts for 45 percent of sales, or $138 million. Assume, for simplicity, that all shoe sales are made by corporations. Of the remainder of $62 million (if we accept the 45 percent figure for purchased inputs), some goes for state taxes, some for local taxes, some for federal income taxes; some is used for new equipment; some is paid out in dividends. Just what the true proportions are is not known. Let us say that of the $20 million for these various items, 10 percent or $2 million is paid out as dividends. Suppose that half of the dividends are received by residents of Massachusetts. Then, another $1

million is received as dividend income in Massachusetts. These two amounts--$107 million for direct wages, and $1 million for dividends received by Massachusetts residents--are together called direct income attributable to the sales of shoes.

Direct income does not exhaust the effect on Massachusetts. Some $138 million (by the estimate used), or 45 percent of total sales, was used to buy goods and services from other firms. Some--though not all--of these firms are located in Massachusetts. For these firms, the sales to the shoe factories are new sales; and the receipts of these supplying firms from these sales will in turn be divided into wages, purchases from still other firms, state and local taxes, dividends, etc. Those purchases from still other firms will have a similar effect on the suppliers to the shoe manufacturers; who, in turn, will have an effect on the suppliers of the suppliers of the suppliers. Obviously, at each round the amounts involved become smaller; only a fraction of sales goes to purchase inputs each time; and only some fraction of those purchases comes from Massachusetts firms. (In the case of shoes, a large proportion of the purchases are for leather; the supplying firms in turn buy hides, many of which come from outside the state.) At each stage, some wages are generated and some dividends are received by Massachusetts residents. Now, imagine adding up all the wages paid by supplying firms as a result of the shoe exports; this is called the indirect wages generated. Similarly, the sum of all the indirect wages plus the sum of all dividends received by shareholders of supplying firms is indirect income received.

Even direct and indirect income received does not exhaust the effect. First, remember that state and local taxes are generated by this process; there is a state profits tax which is clearly affected by the sales. There are also property taxes, whose base depends on the existence of viable businesses. Second, remember that the direct and indirect income raises the income levels of residents of Massachusetts. When people have higher incomes, they typically spend more--and some of that additionaly spending (induced spending, it is called) is done in Massachusetts. This induced spending in Massachusetts leads to more direct and indirect income (provided there were unemployed workers available--which, regrettably, there are in abundance in all of New England); which in turn sets off additional spending, which creates more income, which leads to more spending. . . . The process can be thought of as going on forever; but the amounts involved rapidly become small. The amounts spent are always greater than the income generated as a result on any one round, because some of the purchases are, directly or indirectly, from out of state firms, and some money leaves for federal taxes. Further, when income rises by some amount, the additional spending starting off the next round is smaller than the income creating it. This whole process is called a multiplier chain, and the total extra income ultimately emanating from this source is called induced income. Now, the total income in Massachusetts attributable to the shoe exports is the sum of the direct, the indirect and the induced income. This sum could be either greater or less than the total sales,

depending on the exact relationships involved. Obviously, the sum of direct, indirect and induced income is a more complete measure of the impact of shoe exports than direct income alone.

Along with income, measures of impact of exports on the Massachusetts economy which help in understanding are the amount of state tax receipts involved, and the number of jobs created. One can also consider the total volume of sales of all industries attributable to the exports. All of these can be considered in terms of direct effects only, or in terms of direct, indirect and induced effects. The sum of direct, indirect and induced effects--let us call this sum the total effect--is always greater than the direct effect alone. Total income attributable to a particular export is always greater than direct income only; total employment is always greater than direct employment; and so forth. Total effects are clearly the ones needed to provide a comprehensive understanding of the effects of exports on the economy. Regrettably, total effects are also much more difficult to estimate accurately, since they require vast amounts of information on the interrelations of the industries in the economy.

Clearly, nothing in this analysis is peculiar to the shoe industry. It pertains just as well to the travel service industry. Technical problems of estimation become more difficult in the travel service industry because of the variety of businesses and the variable content of sales; and also because of the fact that there are many more small businesses in which self-employment is a significant fraction of labor income.

But these are technical problems which make estimation more difficult, and not differences in principle. An essential ingredient in the estimation of indirect and induced income, employment and sales or tax receipts is a very complex body of information known as an input-output table. Such a table shows the amount of purchases by any one industry from each of the other industries, as well as payments to workers. Putting together an input-output table which is reasonably accurate is a massive amount of work. By present standards, a "small" table distinguishes about 80 industries (called an "80-sector table)--which requires some 6,400 entries. Larger ones tend to be more precise, in that the individual industries can be spelled out more specifically, rather than being lumped together with other industries only vaguely related.

We have expended considerable effort on this aspect of the work. The heart of our analytic machine here is a table published by the U.S. Department of Commerce, Bureau of Economic Analysis (the "BEA Table") based on the 1967 Census of Business. This table is one of the largest in existence; it distinguishes 484 industries (which means that the resulting table has some 234,000 entries!) for the United States as a whole. We have adapted this table for Massachusetts and, in the process, updated some of its components with information derived from the 1972 Census of Business. (The BEA has been working on a new table, to be based on the 1972 Census of Business. When it becomes available, we can adapt it at little extra cost by using the materials developed and information collected for adapting

the 1967 table.) The methods of adjustment are intimately bound up with technical details of the construction of input-output tables in general, and of the BEA table in particular--so we defer discussion of them here to the forthcoming Manual mentioned in Chapter I.

Construction of the BEA table was a major task for the BEA--typical work in process time is about five years. Adaptation and partial updating was a major task for us as well. A large amount of ancillary data was needed, as was a good deal of analytic work and special computer programming. (Handling such large tables without a large computer would be totally unthinkable!) The present table is, we think a very substantial improvement of the 80-sector 1963 table used for illustrative purposes in our initial (1974) Report. The economic impact analysis in this report, based on the adapted BEA table, supersedes those given in the earlier report for two reasons: first, the present analysis is based on a much better input-output table; and second, the earlier analysis is marred by an error in one computer program used, which we discovered while comparing several alternative tables.

The analysis of the economic impact of travel expenditures proceeds as follows: first, figures are given on the direct impact of travelers' expenditures on the economy of individual counties, as measured by the amount of payrolls (income from wages and salaries) directly due to travelers' expenditures. Second are given the total impact figures (direct, indirect, and induced) of travelers' expenditures, as measured

(successively) by the gross sales, the income, the employment, and the state tax receipts generated by travelers' expenditures.

Direct Impact

Tables 9 and 10 show estimates of employment for each county, for each season, directly attributable to travelers' expenditures. This employment (mostly in hotels, restaurants and retail businesses) does not include the self-employed owners of the small businesses which characterize these industries--the store owners, service station owner-managers, motel owner-managers, family-run restaurants. It includes only employees, hired for wages. In Tables 11 and 12, the estimates of employment in each county are presented as percentages of all employment in private firms in the county.

These percentage figures compare employment due to travelers' expenditures with all non-public employment, not with all employment, because that is the way the data are available. Since some public employees (e.g., police, lifeguards) are employed because of the presence of travelers, inclusion of public employees would raise both the number of employees due to travelers' expense, and (of course) the total employment figure for the county--whether the percentage computed with public employees considered (if it were possible to do so) would rise or fall is an open question.

The figures for the entire year are more accurate than the figures for the individual seasons. One of the steps involved in estimating these figures consists of multiplying total

expenditures of travelers in each category by the ratio of payroll to sales for the corresponding business firms; thus expenditures on commercial lodgings were multiplied by the average ratio of payroll to sales in hotels and motels, and similarly for other expenditure categories. The ratio of payroll to sales figures, though, had to be taken from census data; figures are given in the census by county for each industry for the entire year, but not for season. Now, in an industry in which seasonal patterns are marked (such as hotels and motels), the ratio of payroll to sales varies with the season. The ratio is higher in the slack season than in the busy seasons; when sales figures expand, payrolls expand less than proportionately to sales. As a consequence, the figures given for the spring and especially the summer quarters for employment are probably too high; and those for the fall and winter are likely too low. This problem is more severe, the greater the fluctuation in sales over the year. Consequently, the degree of error is likely to be worst in Barnstable, Dukes and Nantucket Counties.

The dependence of the various counties on direct travel service industry employment varies greatly, as can be seen in Tables 11 and 12. In 1975, 48 percent of all employment in Barnstable County was due to travelers' expenditures; the corresponding figure for 1976 was 39 percent. Nantucket, with 24 and 34 percent in the two years, and Dukes, with 20 and 26 percent, are also very high. For the three counties with the greatest direct dependence, the change is the most dramatic. In 1976, the ratio in Barnstable County rose from 21 percent in

the winter to 67 percent in the summer, then fell to 18 percent in the fall; and Dukes County showed similarly large swings.

Tables 13 to 14 and 13A to 14A are similar to Tables 11 to 12 and 13 to 14. They show, respectively, the total payrolls for the employment shown in Tables 10 and 11, and the percentage of those payrolls to all payrolls in the county. The percentages in Tables 13A to 14A are uniformly lower than the percentages of Tables 11 to 12, reflecting the fact that reported wages in travel service industries are lower than reported wages in other industries. The figures used, however, are reported wages, not wages plus tips, meals, room and other non-payroll benefits often associated with travel service sector employment. Tables 13, 14, 13A and 14A consequently understate the importance of these industries in the economy of the various counties.

In Table 15 are shown estimates of state tax receipts collected directly from travelers through the rooms tax, meals tax, sales tax, liquor excise tax and gasoline tax. For the state as a whole, these amounted to $57.7 million for calendar year 1976. Since total expenditures in 1976 were $1,132 million, state tax collections amount to about 5.1 percent of travelers' expenditures. The collections from individual counties are approximately proportional to the expenditures in the county. The percentage of expenditures going to taxes varies slightly across areas and seasons, depending on the composition of travelers' expenditures.

These direct tax collections do not include taxes collected as a result of the increased income in Massachusetts which

stemmed from the travelers' expenditures. Additional income leads to additional income tax receipts, and to additional expenditure on goods subject to tax--such as restaurant meals, autos, gasoline and the like. Analysis of the total impact of travelers' expenditures on state tax receipts is discussed in the next section. There it is shown that each dollar of travelers' expenditures raised state tax receipts by about 10.9 cents.

Total Impact

As pointed out above, the direct impact of travelers' expenditures by no means captures the entire impact of those expenditures. The full effect requires consideration of the effect on the suppliers of the travel service industries, and on the behavior of those whose imcome is raised as a consequence of this. This full effect, though, cannot be calculated at the county level. To do so, we would need not one, but fourteen input-output tables. Worse, we would need data on the location of suppliers of each product located within the county. Such information is totally unavailable, and cannot be obtained without a major study within each county. The input-output data for Massachusetts can provide information about the impact of expenditures of travelers on the state as a whole--even though it cannot show the effect on the individual counties.

This problem points up one important aspect of the state's economy: no section of the state exists in isolation. Travel service industries in Barnstable County have suppliers, one presumes, in Bristol and Suffolk and other counties. Hence travelers'

expenditures in Barnstable County affect the economies of many--perhaps all--of the other counties in Massachusetts because of indirect effects and because of induced effects. Similarly, a traveler's dollar spent in Berkshire or Bristol or Essex County has indirect and induced effects which are felt all over the state. Suppose that it were possible to do the analysis of indirect and induced effects at the county level as well as the state level; then it would be possible to document the inter-county effects and to measure them numerically. One could then compare the effect on the state as a whole of a dollar of travelers' expenditure with that of the effect on the county in which it occurred, and see the difference. Since such measurement is not possible, we merely point out that it is unquestionable that the impact on the state as a whole is greater than the impact on the county in which the expenditure occurred. An economic stimulus anywhere in the state will be felt, in greater or smaller measure, in other parts of the state.

The total impact of an increase in travelers' spending is manifested only over time. There is a lag in time--perhaps a substantial one--after the initial expenditure before the effect on all suppliers, suppliers of suppliers, suppliers of suppliers of suppliers and so on has worked itself out. Similarly, the resulting change in the behavior of individuals as a consequence of their increased earnings--and of the state government as a result of its increased tax revenue will be worked out only over periods of time. The tables presented are "timeless"; they present only the final impact on the economy--the

impact to be expected after all adjustments have taken place. Studies of speed of adjustment for the national economy show that a large proportion of the impact will be felt within one year, and virtually all within two. We would expect that the response within Massachusetts to be rather faster than this.

Tables 16 to 23 show the estimates of this total impact of travelers' expenditures on the economy of Massachusetts. Those tables are made up of aggregates: dollar volume of sales, of income, of tax receipts; number of jobs. The amounts are large and important to the economy; that is clear.

One comparison between the impact of the travel service industry and other industries is given in Table IV-A. These are the "multipliers," or total impact per dollar of expenditure, on each of four export industries in Massachusetts: travel service, shoes, electrical computing equipment, and electrical measuring instruments. (The last two rather cumbersome names are the official U.S. Census nomenclature for those industries!) It is clear from that table that the shoe industry generates somewhat more further sales per dollar of exports than the travel service industry or the two electrical industries. For the important multiplier of income generated, the industries are all roughly equal, except that the electrical components industry has a somewhat lower figure. The travel service and shoe industries generate more employment per dollar of sales than do the other two industries--a reflection of the higher degree of labor intensity of the first two. The really marked difference comes in the state tax receipt comparison; the im-

Table IV-A

Multipliers (Impact per Dollar of Export Sales) of Four Selected Industries--1976

	Travel Service	Shoes	Electrical Computing Equipment	Electrical Measuring Instruments
Sales	1.718	2.091	1.622	1.728
Income	.852	.892	.700	.828
Employment (per $1000)	.089	.093	.056	.069
State Tax Receipts	.109	.057	.050	.053

Notes: 1. Export sales means sales to persons or firms not resident in Massachusetts.
2. Employment multipliers are given in number of jobs (full time equivalent) per $1000 of sales; others are in dollars per dollar of sales.

pact on state tax receipts per dollar of expenditure by the travel service industry is approximately double that of the other industries. The reasons is straightforward: travel service industries sell products which are subject to excise tax whenever they are purchased; the other industries do not. The effect of this is tantamount to the levy of tax on the exports (as well as domestic sales) of this industry. Naturally, the total effect on state tax receipts is higher by this amount.

Appendix A

The Travel Year and the Travel Areas

Two changes were made this year in statistical procedures, as noted in Chapter I.

The Travel Year

First, the "travel year" was initiated, as explained in the Introduction. The primary basis for the choice of new "seasons" was founded on a study of sales (by month) of commercial lodgings during the three years (1974 through 1976) for which data are available. Tables A-1a and A-1b show some of the comparisons between the new and the old "seasons," using 1976 sales as an example. (Similar results were obtained for other years.) The percentage of sales in each season (for the old and new definitions) and the average percentage per month are shown. The more these percentages differ, the better is the seasonal breakdown used. (If there were no seasonal variation--i.e., all seasons were alike--then each season would have identical percentages.) Inspection suggests that the new seasons are an improvement over the old in this respect.

In Table A-2, some statistical measures are shown which confirm this conclusion. The standard deviation (a measure of variability) of the twelve months, for each county, is shown first; then the standard deviation within each of the seasons for the old and new definitions is given. The more alike the

months comprising an individual season, the lower will be the standard deviation. For the old seasons, most such standard deviations are lower than the corresponding figure for the year. This indicates that the old definitions were in fact useful. The standard deviations based on the new definitions are almost always lower than those based on the old definitions--indicating the apparent superiority of the new definitions.

Finally, the last two columns show a standard statistical measure of effectiveness of classification: the percentage of the variance in the original twelve-month set of figures which is "explained by" (i.e., associated with) the seasonal categories. It will be seen that in all counties except Dukes the new system increases the percentage explained over that explained by the old system. Indeed, the improvement is very large in all areas except the Cape/Isles area. Even there the improvement is substantial for Barnstable and Nantucket, and marginally inferior for Dukes. Clearly the new definitions are a substantial improvement, judged by these criteria, over the old ones.

The Travel Areas

The areas into which the state is divided for purposes of travel measurement are different from those used in 1975. The 1975 Report employed four areas, the current one (1976) uses six. The present division was chosen from a group of twenty-one possible groupings of four, five and six areas. To select the composition of the new travel areas, we used several criteria. First, each area was to be composed of

entire counties, and each county was to be included in only one travel area. Second, the counties comprising an area were to be contiguous, or nearly so. Third, the counties were to be as similar as possible in terms of the importance of tourism in the economies of the counties. Fourth, the counties in an area were to be as similar as possible in terms of the seasonal variation in total sales of hotel and motel rooms, and in terms of the seasonal variation in occupancy rates for hotels and motels.

The first three requirements allowed us to develop some twenty-one combinations. We then calculated for each of the twenty-one groupings the percentage of variance (a measure of variability) in the seasonal pattern of occupancy rates and of taxable sales which could be explained by the grouping. The results were clear-cut and conformed with the fourth criterion as well. The areas most homogeneous in their seasonal pattern are as follows:

Area	Counties
Berkshire	Berkshire
Pioneer Valley	Franklin, Hampshire, Hampden
Mid/South	Worcester, Bristol, Plymouth
North/East	Essex, Middlesex, Norfolk
Suffolk	Suffolk
Cape/Isles	Barnstable, Dukes, Nantucket

All of the above areas are composed of contiguous counties, with the exception of the Mid/South area--a short distance, through Norfolk County or through Rhode Island, separates

Worcester from Bristol County. Bristol and Plymouth are, of course, adjacent.
